Reinforced insulation, Insulation material group 1, Pollution degree 2, and overvoltage category III.

⁽⁶⁾ The results are valid under following conditions: 55°C mean component ambient temperature by continuous operation (8760h per year);
Environment condition: ground mobile, no dust or harmful substances, according to IEC61709; Fit equals one failure per 10⁹ component hours.

General description of sensor function:

The Sensor is sensitive to AC and DC current and can be used for fault current detection in IC-CPD applications or personnel protection systems for EV. The Sensor detects DC & AC fault currents according to IEC62752:2016 and AC fault currents according to UL2231-2 Ed.2. In the event of a DC fault current, PIN 3 will change its state from a low level (GND) to high impedance state. In the event of an AC fault current, PINs 4 and/or 3 will change state from a low level (GND) to a high impedance state, see tab.1. Error conditions (e.g. an internal error) are signaled by PIN 1 (ERROR-OUT) which changes state to high impedance.

Figures:

Fig. 1: Meaning of switching recovery level

If the trip-level $I_{\Delta N1/3}/I_{\Delta N2}$ is accomplished the corresponding output X6/30-OUT/X20-OUT will change its state from low-level (GND) to high impedance. Depending on the existence of the differential current I_{Δ} , the outputs X6/30-OUT/X20-OUT will remain in their states until I_{Δ} is below the recovery threshold $I_{\Delta R1/3}/I_{\Delta R2}$.
